The continuity decision

Start with a customer promise whose failure matters. Establish a usable way to deliver it and an arrangement that willing participants can carry out. Judge the result against the agreed promise. [C1; F2]

Step	The question to answer
1 Promise	What output, quantity, quality, place and deadline will the named customer authority accept?
2 Missing means	Which unavailable record, permission, capability or dependency blocks delivery? What must be constructed?
3 Arrangement	Who agrees to provide what, on which terms? What capacity is actually reserved, including simultaneous demand?
4 Money	What does the complete service cost? Is money available before each payment, including failure obligations?
5 Verification	What evidence would establish or disprove the outcome? Who checks it, with what independence?
6 Comparison	Could a capable conventional option meet the same promise under the same conditions?
7 Next use	What reusable capability remains? Does it help on a different task after transfer costs? Preserve failures too.

State each claim separately

Claim	Evidence you need
Outcome	The required output, actually received and accepted within the frozen conditions.
Service feasibility	Consenting participants, usable capacity, permissions, complete costs, timely funds and workable obligations.
Market evidence	Real independent buying, accepted value, collections and complete costs. Repeated demand supports repeatability.

Give a scoped verdict: supported, failed, or not established. Name the tested setting: tabletop, digital product, physical delivery or real transaction. A completed form does not prove delivery.

DESK REFERENCE 2 OF 2

The cash timing check

Fictional teaching case. The continuity service fee is CAD 5,600. Complete modeled cost is CAD 5,000, leaving a projected contribution of CAD 600. Before acceptance, CAD 4,700 is due but only CAD 1,200 is available. The initial funding gap is CAD 3,500.

Funded positive-control branch

Event	Cash change	Available cash
Starting money	—	1,200
Receive advance	+3,500	4,700
Pay before acceptance	−4,700	0
Receive balance after full acceptance	+2,100	2,100
Pay final inspection	−300	1,800

The reconciliation

The advance and balance total 5,600. Ending cash of 1,800 contains the original 1,200 plus the 600 contribution. The advance is part of the fee. The original customer’s order invoice is outside this service ledger.

When the receipt says 9,800

The promise requires 10,000, with no authorized short shipment. The failed tabletop branch cannot collect the acceptance-dependent 2,100 balance. After the 4,700 payments, cash is zero; the case’s 300 inspection invoice remains unpaid. Record that obligation and any unresolved repair duty. The separate positive-control branch does not erase or fund this failure.

Your first useful action

Choose one commitment, name its owner and acceptance authority, and draft the promise card. Gather the existing recovery plan and a credible alternative. Identify the first missing fact or capability and arrange a bounded tabletop with willing participants. Use the workbook to preserve decisions and the facilitator guide to challenge them.

Course edition 1.0. All amounts and case events above are invented. Your real case needs its own complete cost scope, actual cash timing, consent, failure terms and evidence. Research sources: C1 CONTINUITY Ω, edition 1.1.1; F2 Invent the Economy, October 2026. Originals are included in the archive.
