CONTINUITY Ω

MasterClass 101

Keeping a customer promise through disruption

A three-hour course with one fictional business case

The decision this course teaches

A restored application opens.
Has the customer promise been kept?

- Define an outcome someone can accept.
- Construct a usable and authorized route.
- Check participation, cost and available cash.
- Match the claim to the evidence.

Write your answer and the first observation you would request.

The promise the case requires

K0 defines P1. Every case record and event is simulated.

Requirement	Acceptance condition
Output	10,000 packaging labels, approved artwork v3
Specification	Matte white adhesive stock, 50 × 30 mm, ±0.5 mm; approved code legible
Quality	Damaged labels do not count; no partial acceptance
Time and place	12 November 2026, 16:00 America/Toronto; Montréal site M1, dock 3
Authority	Morgan, the customer’s receiving lead

Which observation would distinguish dispatch from acceptance?

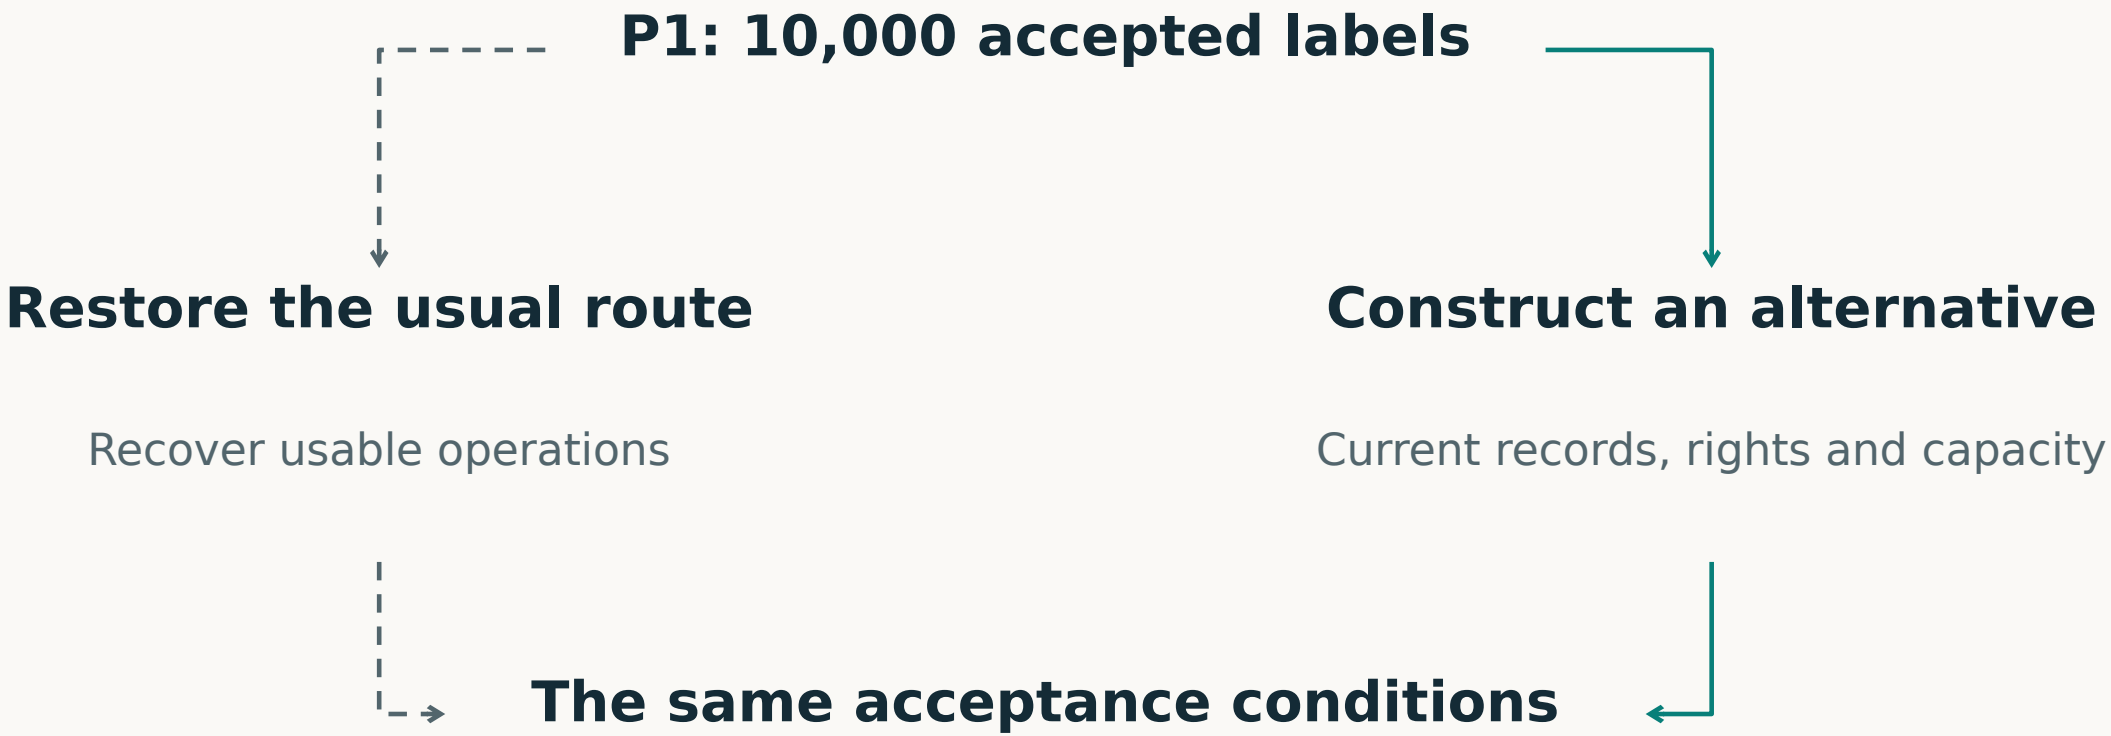

The accepted history changes the quantity

K1 supplies the checkpoint, authorized amendment and custody record.

Record	What it establishes
Checkpoint: 10 Nov., 12:00	8,000 labels in the restored record
A-02: 10 Nov., 14:00	Authorized addition of 2,000 labels
C-01 cutoff: 11 Nov., 12:00	Exercise record lists no later amendment or cancellation
Promise P1	8,000 + 2,000 = 10,000 labels

A matching checksum cannot establish a complete accepted history.

Different routes, the same promise

What is the smallest missing capability that would make an alternative usable?

A capability another provider can use

A plausible plan becomes useful when a recipient can act on it.

Missing condition	Construction and deciding check
Proprietary file unusable	Validated production packet for Printer B’s process
Shared login unavailable	Authorized release channel that does not require it
Quantity still at 8,000	Reconciled order tied to A-02 and the cutoff
AI proposes a route	Reviewer checks its specific claims against sources

A challenger should identify a requirement, a failure and a deciding check.

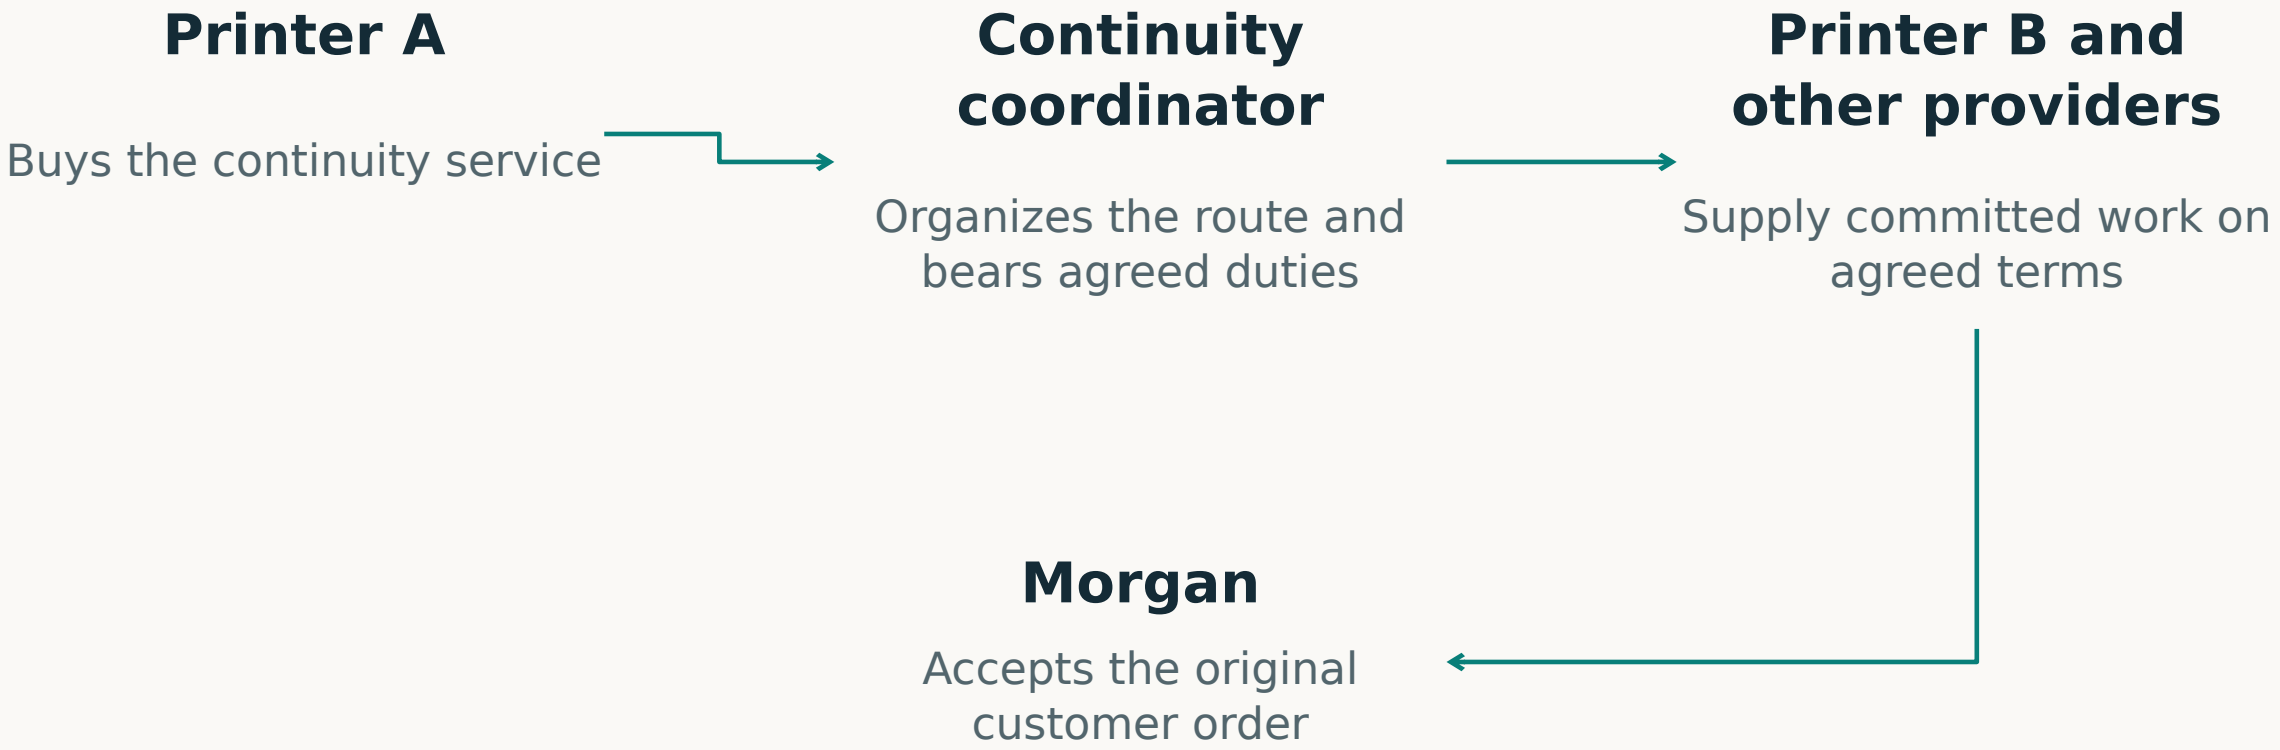

Available capacity is a binding condition

K2 describes a shared slot. Its numbers are teaching assumptions.

Capacity claim	Labels
Nominal alternate capacity	12,000
Protected existing work	2,000
Available for P1	10,000
Additional competing request	5,000

P1 plus the competing request needs 15,000. The free slot holds 10,000.

The continuity service is a separate exchange

Every necessary participant needs authority, usable terms and a reason to agree.

Permissions and failure terms make the deal concrete

K3 supplies exercise permissions. K4 supplies the proposed service terms.

Decision	Question that must be settled
Data and artwork	Who may release which current files to whom?
Production and capacity	Who can commit the slot and protect other work?
Payment and advance	Who agrees, pays, receives and can use the money?
Failure and rework	Who covers correction, cancellation and refund duties?

A useful arrangement can be declined. Consent must remain meaningful.

The complete modeled service cost

K4. Fictional teaching amounts, CAD, on one consistent basis.

Cost item	CAD
Alternate production	3,200
Prepared and checked production packet	550
Transport	400
Coordination, including allocated case overhead	350
Readiness test charge	200
Final inspection	300
Total modeled cost	**5,000**

Fee 5,600 − cost 5,000 = projected contribution 600.

A profitable projection can still be unfunded

Success-case cash plan: the CAD 300 inspection is paid after full acceptance.

4,700

Due before acceptance

1,200

Uncommitted starting cash

3,500

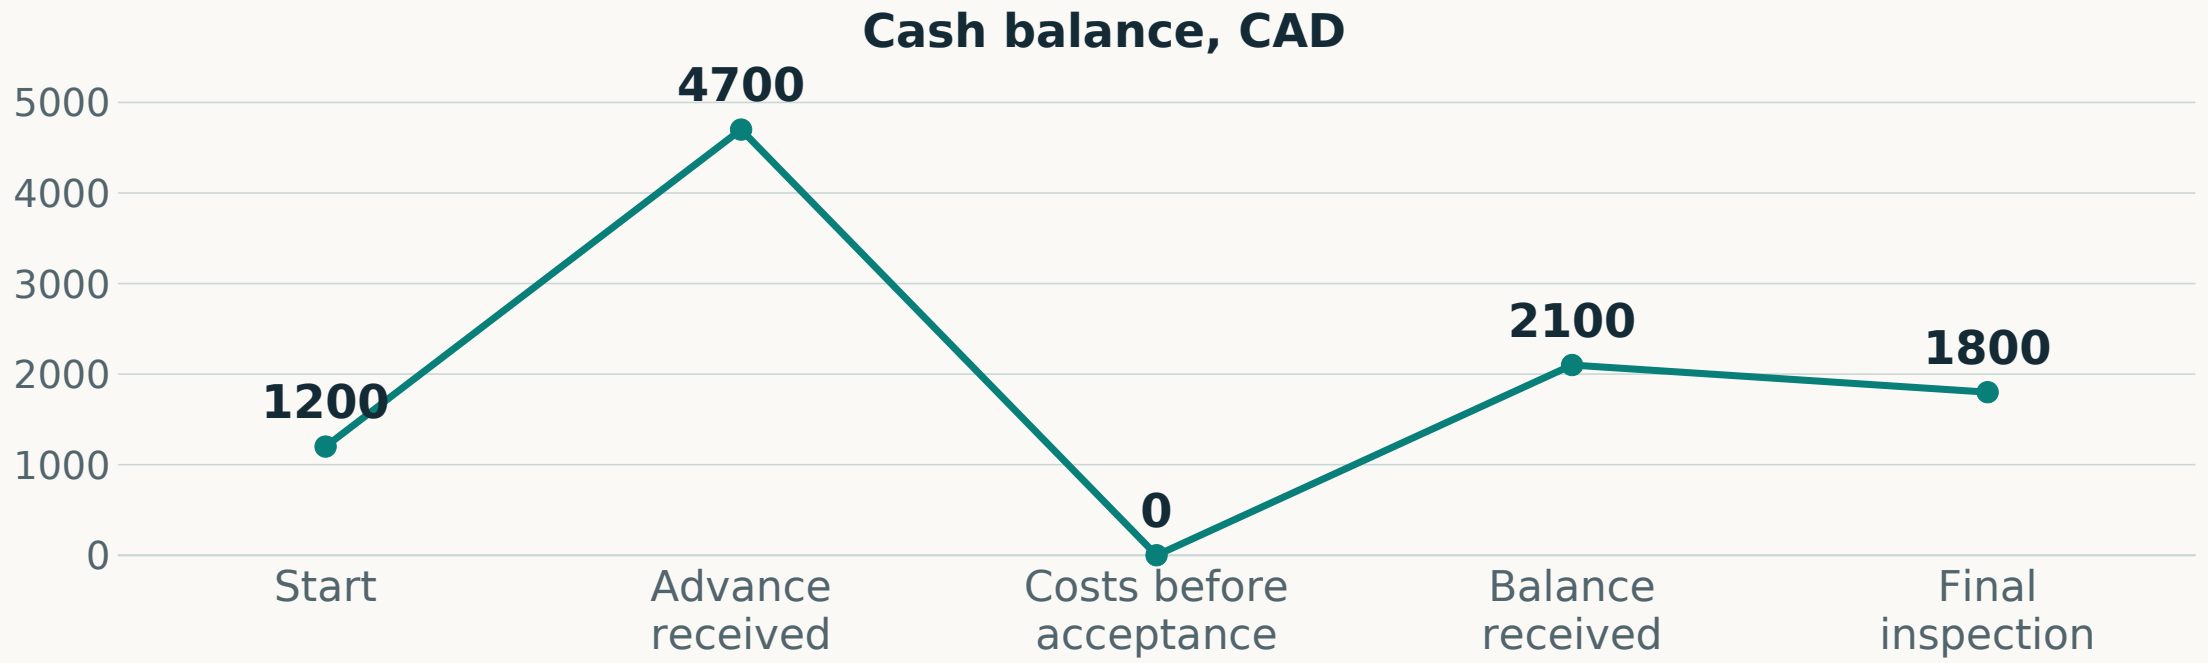

Initial funding gap

CAD in the fictional teaching case

Which payment will arrive before the first cash shortfall?

The funded revision has conditions

Illustrative cash balance, CAD, conditional on full acceptance and collection.

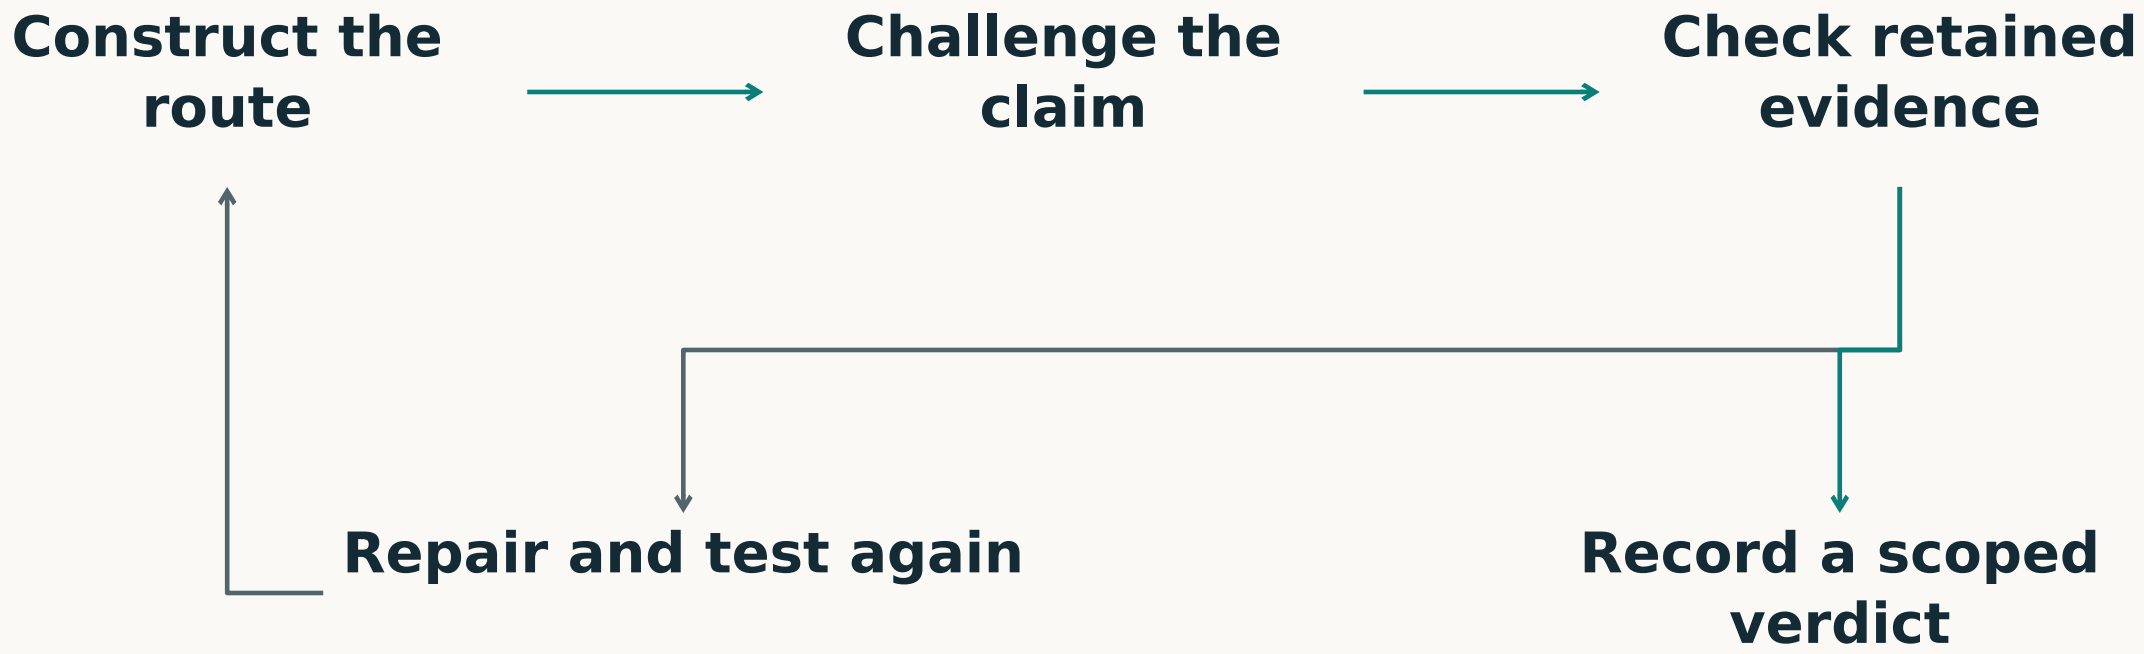

The 3,500 advance is part of the 5,600 fee. Ending cash includes the initial 1,200.

Ten-minute break

When we return: what would justify “the promise was kept”?

Keep the Promise card and Cost and cash ledger nearby.

A claim needs a deciding check

A saved “PASS” label cannot replace the records needed for a fresh check.

Three verdicts prevent false certainty

The verdict always names the claim and the tested setting.

Verdict	What the record supports
Supported within scope	The stated conditions hold in the observed exercise
Failed	An observed condition contradicts the promise
Not established	The available evidence cannot settle the claim

A receipt for 9,800 acceptable labels contradicts P1’s required 10,000.

What the public experiment establishes

Source pin 56aa3e0c, 7 November 2026. A separate research example.

Observed or reported evidence	Boundary
Digital content received and checked locally	Separate implementations on one trusted host
Seven initial method comparisons tied	Both methods completed one changed successor
A later local replay failed at evidence finalization	The affected result remains not established
Other fresh checks passed	They do not erase that retained failure

Policies and money are synthetic. AI advantage, real demand and physical delivery remain unestablished.

A capable alternative deserves a fair comparison

Compare the simplest capable option with the proposed construction.

Hold comparable	Observe separately
Promise, information and permissions	Accepted outcome and delivery time
Available resources and opportunities	Complete cost and cash timing
Preparation and integration scope	Adaptation and verification effort
Acceptance checks and retained records	Failures, exclusions and unresolved facts

Success answers “did it work?” Advantage asks “what did it add?”

Completion and advantage are separate claims

Both methods can succeed.
The added value can still be unknown.

- The reported initial comparisons tied.
- The changed successor supports one scoped reuse result.
- AI performance is marked NOT RUN.
- Untimed human work prevents a complete-cost advantage claim.

Name one observation that would justify choosing the conventional route.

The capstone decision

Can this arrangement satisfy P1? What can you honestly claim now?

- Use K0–K4 to inspect the initial route.
- Record every revision and its deciding evidence.
- Wait for K5 before judging the outcome.
- Keep a later K6 attempt separate.

Workbook w10–w12: histories, decision log and scoped Passport.

The evidence packet changes the decision

K0–K4. Use the complete exhibits in the workbook.

Packet	Decision it informs
K0: promise and specification	What Morgan can accept
K1: checkpoint, A-02 and C-01	Why the obligation is 10,000
K2: capacity and competing work	Why another 5,000 cannot share the slot
K3: permissions and roles	Who may act and authorize
K4: costs, funding and terms	Whether the revised route can be funded

Record the initial problem, the revision, the evidence and the remaining uncertainty.

R1 keeps its failed verdict

9,800 accepted / 10,000 required

K5 leaves 200 labels missing from P1.

- Preserve the failed receipt and the original promise.
- Cash is zero. The K5 inspection invoice of CAD 300 is due.
- Do not book the conditional success cash balance.

The tabletop outcome fails. Actual physical delivery remains unestablished.

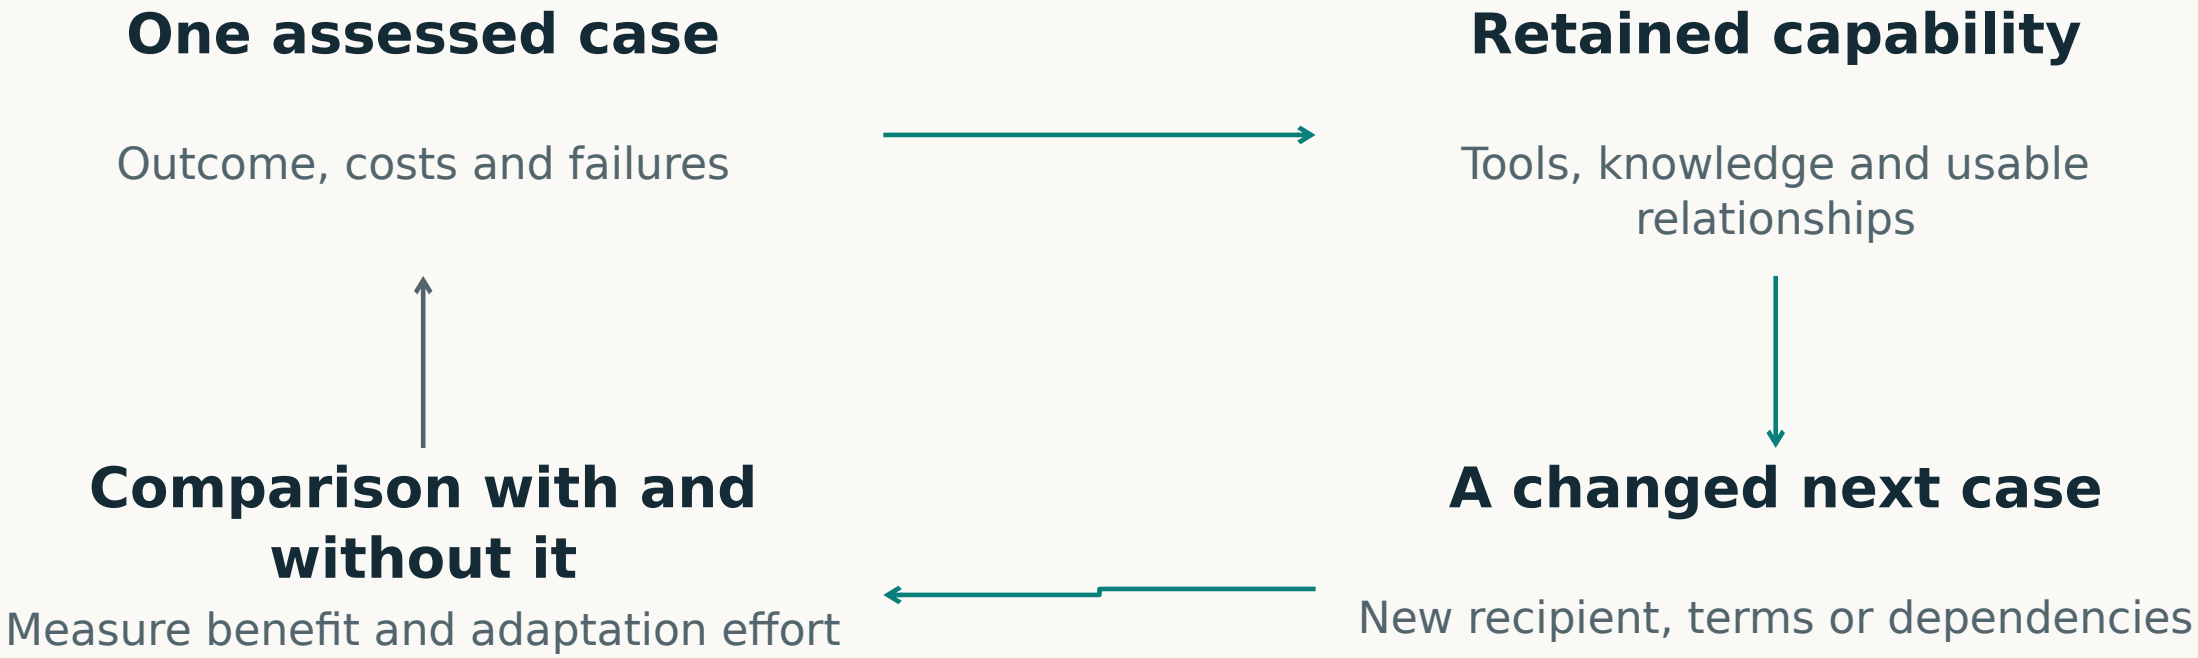

The positive control is a separate branch

K6 starts from a separate fresh assumed state. It does not repair or settle R1.

Record	Permitted conclusion
R1 with K5: 9,800 accepted	P1 failed in this tabletop attempt
R2 with K6: 10,000 accepted under stated conditions	P1 supported in the new tabletop attempt
Physical delivery or real market	Not established by either classroom record

What changed? Which evidence establishes it? What remains outside scope?

A retained capability needs a different next test

Retention is useful when it helps the next case under its own conditions.

Your next useful action

Choose one real promise.
Name one missing condition.
Design one deciding observation.

Return to your baseline answer. Explain what changed and why.

The course demonstrates classroom reasoning. A real rehearsal needs authentic authority and observed evidence.
